Meters 101 - Electro-Mechanical vs Solid-State

Meter Forms

Self-Contained vs Transformer Rated

Blondel's Theorem

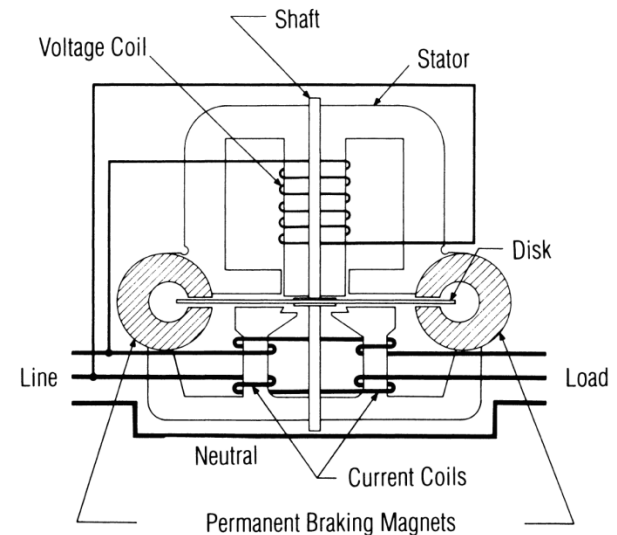

Available References (Hardy's Power Measurement Handbook, UGLY's Elect Ref)

Examples

1S, 2S, 3S, 4S, 5/35S, 8/9S, 16S

# INDUCTION METERS

- Two coils and a conducting (usually aluminum) disk. A braking magnet.
- Magnetic field from the first coil generates *eddy currents* in the disk
- Magnetic field from the second coil interacts with the eddy currents to cause motion
- Disk would accelerate without bound except for eddy currents caused by motion through fixed magnetic field which slows the disk
- The end result is that each revolution of the disk measures a constant amount of energy

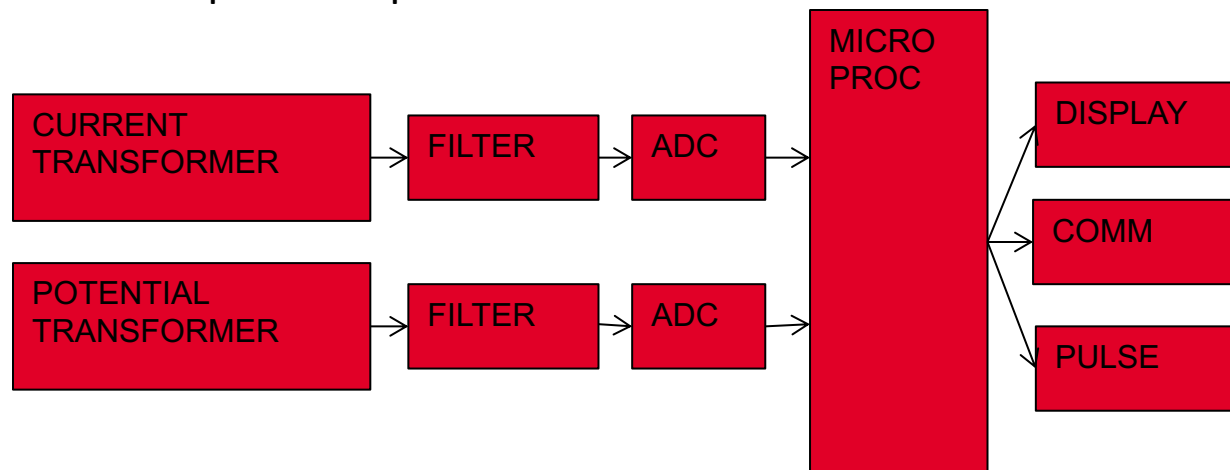

- The essential specification of a watthour meter's measurement is given by the value  
 $K_h$  [ Watthours per disk revolution ]
- A  $K_h$  of 7.2 is typical. In this example, each full rotation of the disk is equivalent to 7.2Wh of energy.
- The watthour meter formula is as follows:

$$E [\text{Watthours}] = K_h \left[ \frac{\text{watthours}}{\text{disk revolution}} \right] * n [\text{disk revolutions}]$$

## Overview of Functionality

- Potential and Current is scaled down and conditioned with transformers and filters
- ADC's (analog to digital converters) digitize the signals
- A micro-processor or DSP executes the calculations
- Resulting data is displayed, sent externally via the communication circuits, and used for the calibrated pulse output

# DIAGRAM EXAMPLE

- 3 Current Coils
- 3 Potential Coils

# BLONDEL'S THEOREM

- French Electrical Engineer Andre Blondel
- Attempt to simplify electrical measurements and validation of the results
- Paper submitted to the International Electric Congress in Chicago in 1893.

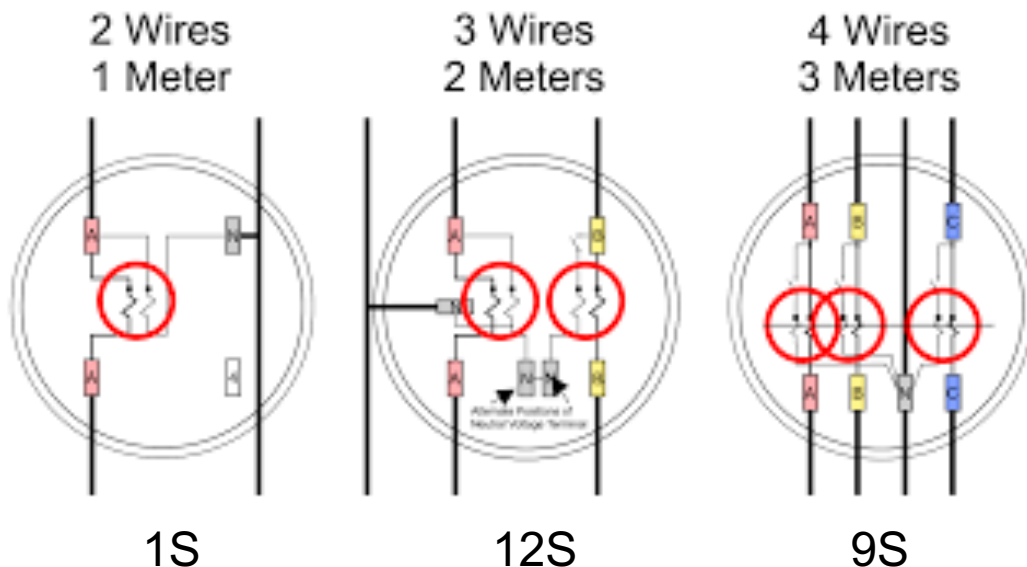

$$E = n - 1$$

*The theorem states that the power provided to a system of  $N$  conductors is equal to the algebraic sum of the power measured by  $N$  watt-meters. The  $N$  watt-meters are separately connected such that each one measures the current level in one of the  $N$  conductors and the potential level between that conductor and a common point. In a further simplification, if that common point is located on one of the conductors, that conductor's meter can be removed and only  $N-1$  meters are required.*

# BLONDEL'S THEOREM

Blondel Compliant

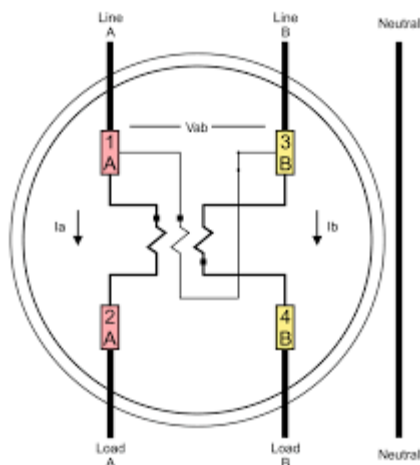

$$E = n - 1$$

*The theorem states that the power provided to a system of  $N$  conductors is equal to the algebraic sum of the power measured by  $N$  watt-meters. The  $N$  watt-meters are separately connected such that each one measures the current level in one of the  $N$  conductors and the potential level between that conductor and a common point. In a further simplification, if that common point is located on one of the conductors, that conductor's meter can be removed and only  $N-1$  meters are required.*

# BLONDEL'S THEOREM

## Non-Blondel Compliant

2S

$$E = n - 1$$

*The theorem states that the power provided to a system of  $N$  conductors is equal to the algebraic sum of the power measured by  $N$  watt-meters. The  $N$  watt-meters are separately connected such that each one measures the current level in one of the  $N$  conductors and the potential level between that conductor and a common point. In a further simplification, if that common point is located on one of the conductors, that conductor's meter can be removed and only  $N-1$  meters are required.*

## Why is non-Blondel metering bad?

- Makes assumptions about the service
- Example: balanced voltages
- Assumptions might not be true
- When these assumptions are not true, then there are power measurement errors even if the meter is working perfectly.

*The theorem states that the power provided to a system of  $N$  conductors is equal to the algebraic sum of the power measured by  $N$  watt-meters. The  $N$  watt-meters are separately connected such that each one measures the current level in one of the  $N$  conductors and the potential level between that conductor and a common point. In a further simplification, if that common point is located on one of the conductors, that conductor's meter can be removed and only  $N-1$  meters are required.*

## Why are non-Blondel meters used?

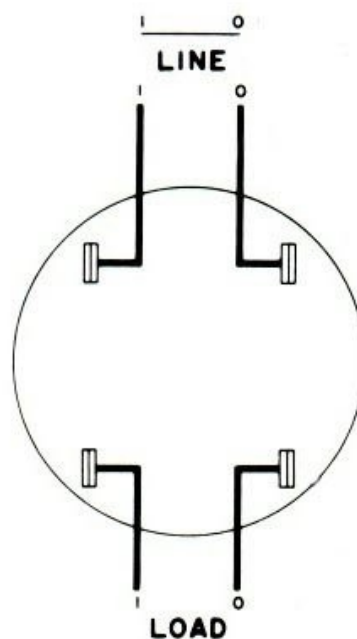

- Fewer elements (meters) = lower cost
- Especially true for electro-mechanical meters
- Fewer CT's and PT's = lower cost
- Less wiring and cheaper sockets

*The theorem states that the power provided to a system of  $N$  conductors is equal to the algebraic sum of the power measured by  $N$  watt-meters. The  $N$  watt-meters are separately connected such that each one measures the current level in one of the  $N$  conductors and the potential level between that conductor and a common point. In a further simplification, if that common point is located on one of the conductors, that conductor's meter can be removed and only  $N-1$  meters are required.*
